Hello Fredrik,

About your question. These reactors are primarily designed for hydrothermal reactions, where typical recommended fill rate is about 50-70%. They are resistant to about 220C and 3MPa, but having said that, we dont have much experience with ethanol. Also, please note there is no safety vent valve on these. There is an alternative version with safety valves as well, but again, we dont have too much experience with ethanol, so please operate with care.
